## Profile

---

Engineering student in Cybersecurity and Artificial Intelligence at ENSA Beni Mellal, preparing for a PFE 2027 internship focused on cybersecurity. I am interested in SOC/DFIR, threat intelligence, application security, IAM, Linux security, Offensive Security labs, and AI-assisted security analysis. Earliest available date for PFE: February 1, 2027.

My profile is cyber-first: incident investigation, evidence collection, controlled exploitation, access-control reasoning, remediation documentation, and security-oriented backend/RAG work. AI is presented as a support capability for cyber analysis, documentation, and secure automation, not as a separate data-science target.

## Technical Skills

---

**Cybersecurity research:** threat intelligence monitoring, alert triage, IOC extraction, incident timelines, MITRE ATT&CK mapping – Splunk, Sysmon, Event Viewer, Linux logs.

**SOC and DFIR:** log correlation, timeline reconstruction, evidence collection, containment and remediation reporting – Splunk, Sysmon, Event Viewer, auditd, Linux logs.

**Application, IAM and platform security:** authentication review, RBAC, MFA/TOTP, rate limiting, account lockout, audit logs, secure configuration review – JWT, Keycloak, Docker Compose, Linux, OpenSSL.

**Offensive Security validation:** reconnaissance, controlled exploitation, impact analysis and remediation documentation in lab environments – Nmap, Burp Suite, Hydra, Netcat, Kali Linux.

**AI Security and secure automation:** AI-assisted threat analysis, RAG security controls, structured documentation and response guidance – FastEmbed, Qdrant, LLM APIs, Python, SQL.

## Experience

---

### PFA Cybersecurity Intern – Early Warning System for Cyber Threats Targeting SMEs

July – August 2026

CMRPI - Espace Maroc Cyberconfiance

- Working on a PFA project focused on threat intelligence monitoring, early cyber threat detection for SMEs, AI-assisted analysis, alerting workflows, and practical response sheets.
- Current scope includes studying threat intelligence sources, collection and analysis workflows, detection-model design options, notification logic, validation planning, and practical security documentation.
- Project context: cybersecurity support for SMEs, with attention to confidentiality, usable reporting, and turning threat information into actionable detection and response guidance.

### Artificial Intelligence / Predictive Maintenance Intern

August 2025

ONEE - Branche Eau, Kasba Tadla

- Prepared and analyzed high-pressure pump sensor data to identify potential fault signals.
- Trained a Random Forest model with Python, Pandas, and Scikit-learn to classify fault risk.
- Documented model evaluation with classification report, confusion matrix, feature importance, ROC, and precision-recall curves.
- Built a desktop test interface and documented the predictive-maintenance prototype.

## Projects

---

### Chatbot USMS v2.0.0

Secure RAG / Backend / Access Control

Academic product, ENSA Beni Mellal / Sultan Moulay Slimane University [GitHub](#)

- Built a multilingual academic assistant providing natural-language access to university FAQs, timetables, and administrative information in French, English, and Arabic.
- Designed a RAG pipeline over PDF/JSON/TXT/MD sources using FastEmbed embeddings, Qdrant vector search, retrieval confidence, and LLaMA-3.3-70B generation through GroqCloud.
- Integrated FastAPI, Next.js 15, PostgreSQL, Redis, Docker Compose, SSE streaming, JWT/RBAC, rate limiting, account lockout, PII masking, audit logs, and automated tests.

## Cybersecurity Projects

---

**Linux Server Compromise & Forensic Investigation Lab**  
*Kali Linux attacker / Ubuntu target, SSH, UFW, auditd, Fail2ban* [GitHub](#)

Offensive Security / DFIR

- Built and documented a controlled scenario: reconnaissance, SSH brute force, initial access, malicious user creation, GTFOBins privilege escalation, persistence, and reverse shell.
- Collected defensive evidence: SSH connections, executed commands, sudo activity, created accounts, network flows, auditd artifacts, reverse shell port, and attack timeline.
- Validated remediation steps: UFW blocking, account removal, password reset, sudo/SSH review, and Fail2ban activation.

**Volt Typhoon Intrusion Investigation**  
*TryHackMe, Splunk, simulated Windows and application logs* [Write-up](#)

SOC / Threat Intelligence

- Investigated a simulated intrusion involving compromised account activity, PowerShell/WMIC, web shell usage, Mimikatz, C2 communication, and log clearing.
- Reconstructed incident phases, extracted IOCs, built a timeline, and mapped observed activity to MITRE ATT&CK tactics and techniques.
- Proposed detection and remediation ideas to improve monitoring and incident response.

## Education

---

**Engineering Cycle – Cybersecurity and Artificial Intelligence**  
Sultan Moulay Slimane University – National School of Applied Sciences, Beni Mellal

2024 – Present

**DEUST – Mathematics, Computer Science and Physics, with honors**  
Sidi Mohamed Ben Abdellah University – Faculty of Sciences and Technologies, Fes

2022 – 2024

**Scientific Baccalaureate, Series D, high honors**  
Lycee de Djagble, Togo

2022

## Certifications and Achievements

---

Cisco Ethical Hacker | Google Cybersecurity Professional Certificate | TryHackMe AI Security Learning Path | TryHackMe Junior Penetration Tester Learning Path | IBM Introduction to Data Engineering.  
CSIA CTF 2026: 1st place, Team GHOSTSHELL | CiteFlag 2026: finalist, 6th place with Team CHILA | MACC 2026: participant.

## Languages

---
